| **Course: BSc(Hons) Applied Software Development (UI310)** |
|---|
| Module: Databases |

This module introduces the students to agile team-working practices, learning strategies and relational databases. The technical objectives focus on relational databases where students will learn how to break down a problem into a logical design. Students will build on their personal development plan by learning about different learning strategies and identify which ones work for them. This module will help students develop confidence in team situations and learn which communication methods to utilise depending on what they are trying to discuss. Like the approach for learning programming, students will be encouraged to use a variety of database software based on the needs of the project.
